

# SUBLIMATION

Sublimation is a process by which a liquid (ink) is turned into a gas as it is heat pressed into your object. For sublimation to work you need the proper dye-sublimation ink, proper printer, a heat press and your objects to be polyester or polyester coated. Any clothing that is 100% - 50% polyester will work. The more polyester the better. Your objects, such as coffee mugs, key chains, ornaments etc are all specially made products with a polyester coating on them. You can buy polyester spray, but the process is hard and if you do not get an even coating then your final product will not turn out so well.

Why is this an awesome process for you? Well, your imagination is your only limit. Anything you can print can go onto your product. That means you can design something yourself with your own art talents, you can take a picture drawn by your child, a photo, something found on the net (as long as there are no licenses on it) and transfer that to your product.

There are no set up fees, you can make one just as simply as you can make 20. Design or upload to computer, print, press, done.

T-Shirts for weddings, Mugs for birthdays, Baby Shower gifts. The list goes on. Sublimation will not peel.
